Executive Summary

Influenza can cause outbreaks of severe respiratory illness among hospitalized persons and long-term care residents. Influenza outbreaks in hospitals and long-term care facilities have been associated with low vaccination rates among healthcare personnel (HCP)¹. Healthcare personnel are especially at risk for exposure to influenza because they work directly with patients or handle material that could spread infection. Annual influenza vaccination for healthcare personnel has been recommended by the Centers for Disease Control and Prevention (CDC) since 1981. The Advisory Committee on Immunization Practices (ACIP) and the Utah Department of Health (UDOH) strongly support the recommendation for annual influenza immunization of healthcare personnel to reduce rates of healthcare-associated infections (HAIs). The ACIP also recommends that measures be taken to increase healthcare personnel immunization rates, and that those rates be used as a measure of the quality of a patient safety program.

Utah Administrative Rule 386-705² requires that hospitals report healthcare personnel influenza vaccination rates. Additionally, Rule R432-40³, Long-Term Care Facility Immunizations, requires long-term care facilities to report the influenza immunization status of employees each year. The Utah Healthcare Infection Prevention Governance Committee* (UHIP GC) also recommends that all healthcare delivery facilities in Utah implement a policy of compulsory** annual influenza vaccination for all healthcare personnel, unless an organization has achieved a vaccination rate greater than 95% by other means.

The information in this report is collected from annual data reported by all licensed hospitals and long-term care facilities on the number of healthcare personnel who were vaccinated for seasonal influenza. Data were collected from the National Healthcare Safety Network (NHSN), Utah REDCap Reporting System and Long-term Care Immunization Reporting System, and are complete at the time of report generation.

The report contains the following data:

- Self-reported data to the Utah Department of Health and to the National Healthcare Safety Network by each Utah hospital required to report influenza vaccination for healthcare personnel
- Identified hospitals
- A comparison of hospital data by influenza season
- A comparison of hospital data by facility type
- A comparison of hospital data by public health district
- Self-reported data to the Utah Department of Health by each long-term care facility required to report influenza vaccination for healthcare personnel.

Influenza vaccination rates for healthcare personnel in Utah licensed hospitals have increased consistently from 75.5% for the 2008–2009 influenza season to 93.3% for the 2019–2020 influenza season. Influenza vaccination rates for healthcare personnel in long-term care facilities have increased from 46.8% for the 2008–2009 influenza season to 61.6% for the 2019–2020 influenza season.

*The Utah Healthcare Infection Prevention Governance Committee is a multi-disciplinary panel of state leaders in patient safety, infectious diseases, and infection control. Membership is comprised of a broad base of care delivery groups across the state and organized under and staffed by the Utah Department of Health.

**Employer requirement for influenza vaccination.

The UDOH and UHIP GC recognize that influenza vaccination of healthcare personnel is a critical patient safety practice and continue to support compulsory influenza vaccination for healthcare personnel in all healthcare facilities. The UDOH will continue to encourage all hospitals and long-term care facilities to achieve influenza vaccination rates for healthcare personnel of 95% or greater.

Key Findings

This report was developed by the UDOH in collaboration with the UHIP GC. The information in this report is collected from annual data reported by all licensed hospitals and all long-term care facilities on the number of healthcare personnel that were vaccinated for seasonal influenza.^{4,5} Hospital and state-specific influenza vaccination rates were determined by collecting data on the number of healthcare personnel at each licensed hospital in Utah and the number of healthcare personnel who were vaccinated for seasonal influenza. Vaccination rates were calculated by dividing the number of healthcare personnel vaccinated by the total number of healthcare personnel.

Table 1. Influenza vaccination coverage among healthcare personnel in hospitals, Utah, 2019–2020

Percentage of hospitals reporting	Statewide HCP vaccination coverage	Range of HCP vaccination coverage by public health district	Range of HCP vaccination coverage by hospital
90.8%	93.4%	88.9-98.9%	85.7-100%

The UDOH does not *require* Utah hospitals to have compulsory influenza vaccination policies for healthcare personnel; however, some Utah healthcare facilities have such policies in place.

Table 2. Compulsory influenza vaccination policies among hospitals, Utah, 2019–2020

	Hospitals with compulsory vaccination policies	Hospitals without or with unknown compulsory vaccination policies	Total number of hospitals
Hospitals with \geq 95% coverage	27 (49.1%)	3 (75.0%)	30
Hospitals with <95% coverage	28 (50.9%)	1 (25.0%)	29
TOTAL	55	4	59

NOTE: Six (6) hospitals did not report.

Table 3. Influenza vaccination coverage among healthcare personnel in long-term care facilities, Utah, 2019–2020

Percentage of LTCF reporting	Statewide HCP vaccination coverage	Range of HCP vaccination coverage by public health district	Range of HCP vaccination coverage by LTCF
100.0%	61.6%	54.5-76.2%	0–100%

Table 4. Compulsory influenza vaccination policies among long-term care facilities, Utah, 2019–2020

	LTCF with compulsory vaccination policies	LTCF without or with unknown compulsory vaccination policies	Total number of LTCF
LTCF with \geq 95% coverage	25 (39.7%)	17 (5.9%)	42
LTCF with <95% coverage	38 (60.3%)	270 (94.1%)	308
TOTAL	63	287	350

Recommendation

The UDOH and the UHIP GC continue to recommend that all healthcare delivery facilities in Utah implement a policy of compulsory annual influenza vaccination for all healthcare personnel, unless an organization has achieved a vaccination rate greater than 95% by other means.

Descriptions

Throughout this report, the following definitions are used to describe the comparison data in tables 7–32 for each public health district.

Licensed Hospitals or Licensed Long-term Care Facilities (LTCF)

Utah licensed hospitals include: acute care, long-term acute care, critical access, rehabilitation, psychiatric, children's, and government hospitals. Long-term care facilities include: assisted living types I and II, nursing care and small healthcare facilities.

Number of healthcare personnel (HCP)

Total number of healthcare personnel employed in the licensed hospital or long-term care facility.

Vaccinated healthcare personnel (HCP)

Total number of healthcare personnel employed in the licensed hospital or long-term care facility who received the influenza vaccine during the 2019–2020 influenza season.

Vaccination percentage

Vaccination coverage levels of healthcare personnel who received influenza vaccine during 2019–2020 influenza season.

The **red line** on tables in each health district indicates facilities below 95% vaccination coverage.

Introduction

Influenza is a contagious respiratory illness caused by influenza viruses. It can cause mild to severe illness and can result in hospitalization or death. Some people, such as older people, young children, and people with certain health conditions, are at high risk for serious influenza complications. More than 200,000 persons, on average, are hospitalized each year for influenza-related complications in the U.S. Healthcare-associated influenza infections can occur in any healthcare setting and are most common when influenza is also circulating in the community.⁷ The best way to prevent influenza is by getting vaccinated each year.

Influenza is also one of the leading causes of employee absences, causing millions of lost workdays and lost wages. Some estimates suggest that 10–12% of all employee absences are due to employees contracting the influenza virus. Each infected employee might miss up to six days of work and need up to two weeks to make a full recovery. Additional considerations include costs related to lowered productivity when ill employees are at work, slowed projects, or wages and training needed for temporary workers. Many employees also miss work to care for ill family members. The more children get sick, the greater the likelihood that employees will miss work or unknowingly become a carrier of the virus, spreading it at the workplace. The end result means seasonal influenza is a costly disease to patients, employers, and society in terms of direct and indirect medical costs and lost productivity.⁸

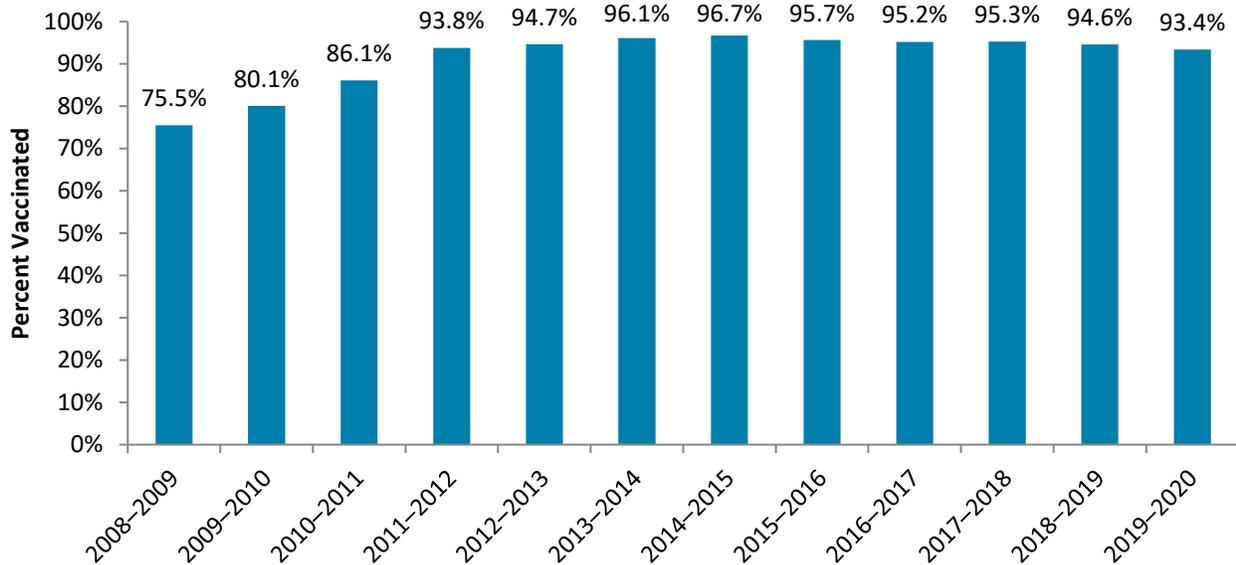

Healthcare personnel are especially at risk for exposure to influenza because they work directly with patients or handle material that could spread infection. Annual influenza vaccination was first recommended for healthcare workers by the Advisory Committee on Immunization Practices in 1984. Annual influenza vaccination for healthcare personnel is recommended by several national organizations, such as the Centers for Disease Control and Prevention (CDC), Infectious Disease Society of America (ISDA), American Academy of Pediatrics (AAP), American Hospital Association (AHA), and the Association for Professionals in Infection Control and Epidemiology (APIC), to reduce the likelihood healthcare personnel will get or spread influenza. Many of these same organizations support *mandatory* influenza vaccination policies for healthcare personnel. Healthcare personnel can protect themselves, their patients, and family members by getting vaccinated.

Vaccination of healthcare personnel can specifically benefit patients who cannot receive vaccination (i.e., infants aged <6 months or those with severe allergic reactions to prior influenza vaccination), patients who respond poorly to vaccination (i.e., persons aged >85 years and immune-compromised persons), and persons for whom antiviral treatment is not available (i.e., persons with medical contraindications).

Influenza vaccination of healthcare personnel is a critical patient safety practice that should be required in all healthcare facilities. Clinical evidence clearly shows healthcare personnel influenza vaccination reduces patient infections and deaths. Healthcare facilities that have adopted such policies have shown dramatic improvements in healthcare personnel vaccination rates.⁹ The UDOH and the UHIP GC continue to support the position that patients should reasonably be able to expect that they will not contract potentially life-threatening illnesses, such as influenza, from their healthcare providers while being treated for other conditions.

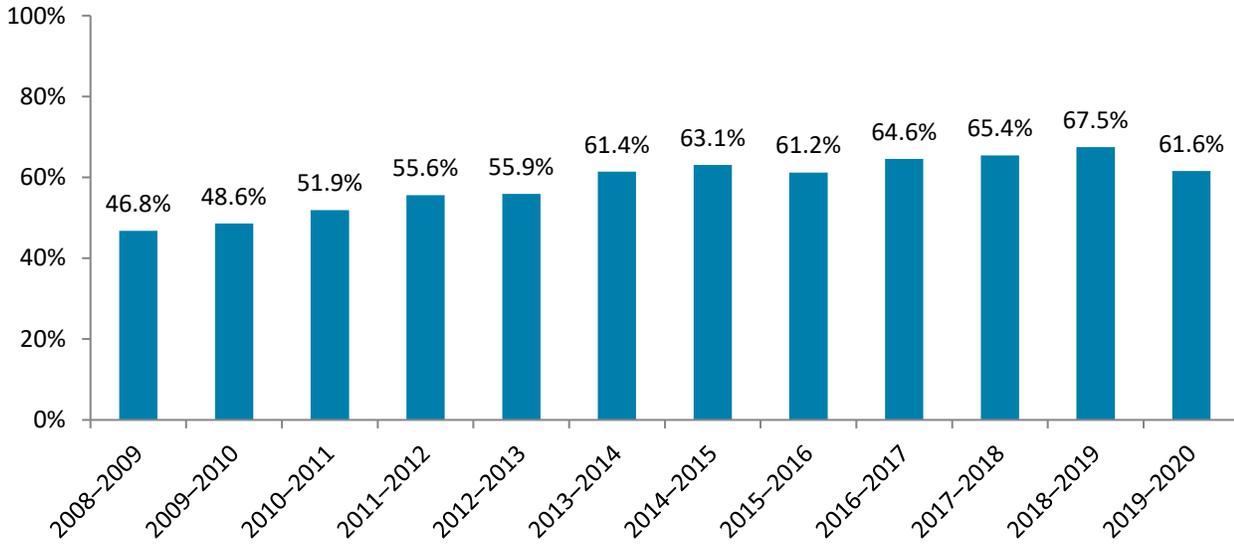

Influenza Vaccination Coverage by Influenza Season

Figure 1. Influenza vaccination coverage rates for healthcare personnel in licensed hospitals by influenza season, Utah, 2008–2020*

***NOTE:** In previous reports, influenza vaccination coverage rates for healthcare personnel in licensed hospitals from 2008–2009 through 2011–2012 were reported as an average vaccination percentage across all Utah hospitals, rather than as an overall state percentage. This graph reflects the adjusted percentages with influenza seasons from 2008–2009 through 2019–2020 reported as an overall state percentage.

Figure 2. Influenza vaccination coverage rates for healthcare personnel in long-term care facilities by influenza season, Utah, 2008–2020

Influenza Vaccination Coverage by Facility Type

Table 5. Influenza vaccination coverage for healthcare personnel in licensed hospitals by facility type, Utah, 2019–2020 influenza season

	Number of hospitals	HCP vaccination percentage	Range of vaccination percentages
Acute care hospitals	36	93.7%	85.7–100%
Children’s hospitals	2	87.0%	86.4–100%
Chemical dependency hospitals	0	Not Reported	Not Reported
Critical access hospitals	11	95.6%	89.5–100%
Government hospital	0	Not Reported	Not Reported
Long-term acute care hospitals	3	97.2%	95.4–100%
Psychiatric hospitals	5	97.1%	90.1–99.5%
Rehabilitation hospitals	2	98.8%	98.4–100%

Table 6. Influenza vaccination coverage for healthcare personnel in long-term care facilities by facility type, Utah, 2019–2020 influenza season

	Number of facilities	HCP vaccination percentage	Range of vaccination percentages
Assisted living – Type I	68	51.4%	0–100%
Assisted living – Type II	166	49.3%	0–100%
Nursing care facility	108	70.8%	51.7–100%
Small healthcare facility	8	46.2%	0–70.6%

Influenza Vaccination Coverage for Healthcare Personnel in Licensed Hospitals and Long-term Care Facilities by Public Health District

Definitions

The following are definitions used in this report.

- 1. The Advisory Committee on Immunization Practices** — A group of medical and public health experts that develops recommendations on how to use vaccines to control diseases in the United States. The recommendations stand as public health advice that will lead to a reduction in the incidence of vaccine preventable diseases and an increase in the safe use of vaccines and related biological products.
- 2. Healthcare personnel (HCP)** — All paid and unpaid persons working in healthcare settings who have the potential for exposure to patients and/or to infectious materials, including body substances, contaminated medical supplies and equipment, contaminated environmental surfaces, or contaminated air. Healthcare personnel might include (but are not limited to) physicians, nurses, nursing assistants, therapists, technicians, emergency medical service personnel, dental personnel, pharmacists, laboratory personnel, autopsy personnel, students and trainees, contractual staff not employed by the healthcare facility, and persons (i.e., clerical, dietary, housekeeping, laundry, security, maintenance, administrative, billing, and volunteers) not directly involved in patient care, but potentially exposed to infectious agents that can be transmitted to and from healthcare personnel and patients.
- 3. Healthcare-associated infection (HAI)** — An infection that develops in a resident who is cared for in any setting where healthcare is delivered (i.e., acute care hospital, skilled nursing facility, dialysis center, etc.) that was not developing or present at the time of admission to that setting.
- 4. Hospital facility types**
 - Acute care** — A facility that provides diagnostic, therapeutic, and rehabilitative services to both inpatients and outpatients by (or under) physician supervision.
 - Long-term acute care (LTAC)** — A hospital that provides on-site all basic services required of a general hospital that are needed for the diagnosis, therapy, and treatment offered or required by all patients admitted to the hospital, including pharmacy, laboratory, nursing services, occupational, physical, respiratory and speech therapies, dietary, social services, and specialized diagnosis and therapeutic services.
 - Children’s hospitals** — For purposes of this report, a children’s hospital refers to Primary Children’s Medical Center and Shriners Hospital for Children in Salt Lake City, Utah.
 - Critical access** — A nonprofit, profit, or public hospital that is enrolled as a Medicaid provider and qualifies as a Critical Access Hospital under 42, Code of Federal Regulations, Section 485, Subpart F - Conditions of Participation Critical Access Hospitals. Visit <http://www.CMS.gov> for more information.
 - Government** — For purposes of this report, a government hospital refers to the Veterans Affairs Salt Lake City Health Care System in Salt Lake City, Utah.

Specialty hospital — A facility that provides specialized diagnostic, therapeutic, or rehabilitative services in the recognized specialty or specialties for which the hospital is licensed including, but not limited to, psychiatric and rehabilitation hospitals.

5. Long-term care facility (CDC definition) — Nursing homes, skilled nursing facilities, and assisted living facilities, (collectively known as long-term care facilities [LTCFs]) provide a variety of services, both medical and personal care, to people who are unable to manage independently in the community.

Long-term care facility (Utah Department of Health definition) — A nursing care facility, small healthcare facility, assisted living type I and type II, intermediate care facility for the developmentally disabled, and swing bed unit of a general acute care hospital.
